

# Row-equivalences again

Row spaces bases  
computational techniques using  
row-equivalences

- The **row space** of  $A$  is the span of row vectors.
- The **row rank** of  $A$  is the dimension of the row space of  $A$ .
- **Theorem 9**: Row-equivalent matrices have the same row spaces.
  - proof: Check for elementary row equivalences only.
- **Theorem 10**:  $R$  nonzero row reduced echelon matrix. Then nonzero rows of  $R$  form a basis of the row space of  $R$ .

- **proof:**  $\rho_1, \dots, \rho_r$  row vectors of  $R$ .

- $\rho_i = (R_{i1}, R_{i2}, \dots, R_{in})$

- $$\begin{aligned} R_{ij} &= 0 & \text{if } j < k_i, \\ R_{i,k_j} &= \delta_{ij}, \\ k_1 < k_2 < \dots < k_r. \end{aligned}$$

- Let  $\beta = (b_1, \dots, b_n)$  be a vector in the row space.

$$\beta = c_1 \rho_1 + \dots + c_r \rho_r$$

$$\text{Claim : } c_j = b_{k_j}$$

$$b_{k_j} = \sum_{i=1}^r c_i R_{i,k_j} = \sum_{i=1}^r c_i \delta_{ij} = c_j$$

If  $\beta = 0$ , then  $c_j = 0, j = 1, \dots, r$ .

- $\rho_1, \dots, \rho_r$  are linearly independent: basis

- **Theorem 11:**  $m, n, F$  a field.  $W$  a subspace of  $F^n$ . Then there is precisely one  $m \times n$  r-r-e matrix which has  $W$  as a row space.
- **Corollary:** Each  $m \times n$  matrix  $A$  is row equiv. to one unique r-r-e matrix.
- **Corollary.**  $A, B$   $m \times n$ .  
 $A$  and  $B$  are row-equiv iff  $A, B$  have the same row spaces.

# Summary of row-equivalences

- TFAE
  - A and B are row-equivalent
  - A and B have the same row-space
  - $B = PA$  where P is invertible.
  - $AX=0$  and  $BX=0$  has the same solution spaces.
- Proof: (i)-(iii) done before. (i)-(ii) above corollary. (i)->(iv) is also done. (iv)->(i) to be done later.

# Computations

- Numerical problems:
  - 1. How does one determine a set of vectors  $S=(a_1, \dots, a_n)$  is linearly independent. What is the dimension of the span  $W$  of  $S$ ?
  - 2. Given a vector  $v$ , determine whether it belongs to a subspace  $W$ . How to write  $v = c_1a_1 + \dots + c_na_n$ .
  - 3. Find some explicit description of  $W$ : i.e., coordinates of  $W$ . -> Vague...

- Let  $A$  be  $m \times n$  matrix.
- r-r-e  $R$
- $\dim W = r$  the number of nonzero rows of  $R$ .

$$W = \{\beta \mid \beta = c_1 \rho_1 + \cdots + c_r \rho_r, c_i \in F\}$$

$$\begin{aligned} \beta &= (b_1, \dots, b_n) \\ \beta &= \sum_{i=1}^r c_i R_{ij}, c_j = b_{k_j} \\ \beta &= \sum_{i=1}^r b_{k_i} \rho_i \\ b_j &= \sum_{i=1}^r b_{k_i} R_{ij} \end{aligned}$$

$b_{k_1}, \dots, b_{k_r}$  give a parametrization of  $W$ .

- Example:

$$R = \begin{pmatrix} 1 & 2 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$$b_{k_1}(1, 2, 0, 0) + b_{k_2}(0, 0, 1, 0) + b_{k_3}(0, 0, 0, 1)$$

$$(b_{k_1}, 2b_{k_1}, b_{k_2}, b_{k_3})$$

- (1) can be answered by computing the rank of  $R$ . If  $\text{rank } R = m$ , then independent. If  $\text{rank } R < m$ , then dependent. ( $A=PR$ ,  $P$  invertible.)

- (2):  $b$  given. Solve for  $AX = b$ .
- Second method:  $A=PR$ ,  $P$  invertible.

$$\beta = x_1\alpha_1 + \cdots + x_m\alpha_m$$

$$\rho_i = \sum_{j=1}^m P_{ij}\alpha_j$$

$$\beta = \sum_{i=1}^r b_{k_i}\rho_i = \sum_{i=1}^r \sum_{j=1}^m b_{k_i}P_{ij}\alpha_j = \sum_{j=1}^m \sum_{i=1}^r b_{k_i}P_{ij}\alpha_j$$

$$x_j = \sum_{i=1}^r b_{k_i}P_{ij}$$

- In line 3, we solve for  $b_{k_i}$
- Final equation is from comparing the first line with the second to the last line.

- $$A = \begin{pmatrix} 1 & 1 & 0 & 0 \\ 0 & 2 & 1 & 0 \\ 0 & 1 & -1 & 1 \end{pmatrix}$$

- Find r-r-e R. Find a basis of row space
- Which vectors  $(b_1, b_2, b_3, b_4)$  is in W?
- coordinate of  $(b_1, b_2, b_3, b_4)$ ?
- write  $(b_1, b_2, b_3, b_4)$  as a linear combination of rows of A.
- Find description of solutions space V of  $AX=0$ .
- Basis of V?
- For what Y,  $AX=Y$  has solutions?

$$\left( \begin{array}{cccc|c} 1 & 1 & 0 & 0 & y_1 \\ 0 & 2 & 1 & 0 & y_2 \\ 0 & 1 & -1 & 1 & y_3 \end{array} \right) \quad \left( \begin{array}{cccc|c} 1 & 1 & 0 & 0 & y_1 \\ 0 & 1 & 1/2 & 0 & y_2/2 \\ 0 & 1 & -1 & 1 & y_3 \end{array} \right)$$

$$\left( \begin{array}{cccc|c} 1 & 0 & -1/2 & 0 & y_1 - y_2/2 \\ 0 & 1 & 1/2 & 0 & y_2/2 \\ 0 & 0 & -3/2 & 1 & -y_2/2 + y_3 \end{array} \right)$$

$$\left( \begin{array}{cccc|c} 1 & 0 & 0 & -1/3 & y_1 - y_2/3 - y_3/3 \\ 0 & 1 & 0 & 1/3 & y_2/3 + y_3/3 \\ 0 & 0 & 1 & -2/3 & y_2/3 - 2y_3/3 \end{array} \right)$$

$$Q = \begin{bmatrix} 1 & -1/3 & -1/3 \\ 0 & 1/3 & 1/3 \\ 0 & 1/3 & -2/3 \end{bmatrix}$$

$$R = \begin{pmatrix} 1 & 0 & 0 & -1/3 \\ 0 & 1 & 0 & 1/3 \\ 0 & 0 & 1 & -2/3 \end{pmatrix} \quad Q = \begin{pmatrix} 1 & -1/3 & -1/3 \\ 0 & 1/3 & 1/3 \\ 0 & 1/3 & -2/3 \end{pmatrix}$$

- $R=QA$ .
- Basis of row spaces: rows above,  
dim=3

$$\beta = b_1\rho_1 + b_2\rho_2 + b_3\rho_3 = (b_1, b_2, b_3, -b_1/3 + b_2/3 - 2b_3/3)$$

$$= [b_1, b_2, b_3]R = [b_1, b_2, b_3]QA$$

$$= x_1\alpha_1 + x_2\alpha_2 + x_3\alpha_3$$

$$x_i = [b_1, b_2, b_3]Q_i$$

$Q_i$  is the  $i$ th column of  $Q$ .

$$\begin{aligned}x_1 &= b_1 \\x_2 &= -b_1/3 + b_2/3 + b_3/3 \\x_3 &= -b_1/3 + b_2/3 - 2b_3/3\end{aligned}$$

- $AX=0 \leftrightarrow RX=0$ .  
 $y_1 = u/3, y_2 = -u/3, y_3 = 2u/3$ .  $X = \begin{pmatrix} u/3 \\ -u/3 \\ 2u/3 \\ u \end{pmatrix}$
- $V$  is one-dimensional
- Basis of  $V$ :  $(1, -1, 2, 3)$ .
- $AX=Y$  for what  $Y$ ? All  $Y$ . See page 63.
- Examples 21 and 22 must be thoroughly understood.
