

8.1. Matrix representations of linear transformations

Matrix of a linear operator with respect to a
basis.

Matrix of linear operators w.r.t. a basis

- ▶ One can use different representation of a transformation using basis.
- ▶ If one uses a right basis, the representation get simpler and easier to understand.
- ▶ $x \rightarrow Tx$.
- ▶ $[x]_B \rightarrow [Tx]_B = A[x]_B$ for some matrix A depending on B .
- ▶ How does one find A_B ?
- ▶ This amounts to change of coordinates.
(Coordinates are usually not canonical.)

Theorem 8.1.1 Let $T: R^n \rightarrow R^n$ be a linear operator, let $B = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n\}$ be a basis for R^n , and let

$$A = \left[[T(\mathbf{v}_1)]_B \mid [T(\mathbf{v}_2)]_B \mid \cdots \mid [T(\mathbf{v}_n)]_B \right] \quad (4)$$

Then

$$[T(\mathbf{x})]_B = A[\mathbf{x}]_B \quad (5)$$

for every vector \mathbf{x} in R^n . Moreover, the matrix A given by Formula (4) is the only matrix with property (5).

- ▶ **Proof:** If $[\mathbf{x}]_B = (c_1, c_2, \dots, c_n)$, then $\mathbf{x} = c_1 \mathbf{v}_1 + \dots + c_n \mathbf{v}_n$.
 - $T(\mathbf{x}) = c_1 T(\mathbf{v}_1) + \dots + c_n T(\mathbf{v}_n)$
 - $[T(\mathbf{x})]_B = c_1 [T(\mathbf{v}_1)]_B + \dots + c_n [T(\mathbf{v}_n)]_B$.

$$= \begin{bmatrix} [T(\mathbf{v}_1)]_B & [T(\mathbf{v}_2)]_B & \cdots & [T(\mathbf{v}_n)]_B \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ \vdots \\ c_n \end{bmatrix} = A[\mathbf{x}]_B$$

- ▶ A is called the matrix of T w.r.t. the basis B .
- ▶ $[T]_B = A = [[T(v_1)]_B, [T(v_2)]_B, \dots, [T(v_n)]_B]$.
- ▶ $[T(x)]_B = [T]_B [x]_B$.
- ▶ If S is the standard basis, $[T]_S$ is the standard matrix for T .
- ▶ Example 1.
- ▶ Example 2. A matrix realized as a rotation....

Changing basis

- ▶ What is the relationship between $[T]_B$ and $[T]_{B'}$ for two basis B and B' .
- ▶ $[T]_B[x]_B = [T(x)]_B$. $[T]_{B'}[x]_{B'} = [T(x)]_{B'}$.
- ▶ $P_{(B \rightarrow B')} [T(x)]_B = [T(x)]_{B'}$
- ▶ $P_{(B \rightarrow B')} [x]_B = [x]_{B'}$
- ▶ $[T]_{B'} [x]_{B'} = [T(x)]_{B'}$
- ▶ $[T]_{B'} P [x]_B = P [T(x)]_B$.
- ▶ $(P^{-1} [T]_{B'} P) [x]_B = [T(x)]_B$.
- ▶ Compare to $[T]_B [x]_B = [T(x)]_B$.
- ▶ Thus $P^{-1} [T]_{B'} P = [T]_B$.

Theorem 8.1.2 If $T : R^n \rightarrow R^n$ is a linear operator, and if $B = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n\}$ and $B' = \{\mathbf{v}'_1, \mathbf{v}'_2, \dots, \mathbf{v}'_n\}$ are bases for R^n , then $[T]_B$ and $[T]_{B'}$ are related by the equation

$$[T]_{B'} = P[T]_B P^{-1} \quad (12)$$

in which

$$P = P_{B \rightarrow B'} = \left[[\mathbf{v}_1]_{B'} \mid [\mathbf{v}_2]_{B'} \mid \cdots \mid [\mathbf{v}_n]_{B'} \right] \quad (13)$$

is the transition matrix from B to B' . In the special case where B and B' are orthonormal bases the matrix P is orthogonal, so (12) is of the form

$$[T]_{B'} = P[T]_B P^T \quad (14)$$

- ▶ $[T]_B = P^{-1} [T]_{B'} P$.
- ▶ $[T]_B = P^T [T]_{B'} P$ if B, B' orthonormal basis.

S (standard basis) \rightarrow B.

Theorem 8.1.3 If $T : R^n \rightarrow R^n$ is a linear operator, and if $B = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n\}$ is a basis for R^n , then $[T]$ and $[T]_B$ are related by the equation

$$[T] = P[T]_B P^{-1} \quad (17)$$

in which

$$P = [\mathbf{v}_1 \mid \mathbf{v}_2 \mid \cdots \mid \mathbf{v}_n] \quad (18)$$

is the transition matrix from B to the standard basis. In the special case where B is an orthonormal basis the matrix P is orthogonal, so (17) is of the form

$$[T] = P[T]_B P^T \quad (19)$$

- ▶ Proof: $P = P_{(B \rightarrow S)} = [[\mathbf{v}_1]_S, \dots, [\mathbf{v}_n]_S] = [\mathbf{v}_1, \dots, \mathbf{v}_n]$
- ▶ Some formula: $[T]_B = P^{-1}[T]P$. $[T]_B = P^T[T]P$.

- ▶ Example 3.
- ▶ Example 4. Any reflection can be made into a reflection on x -axis by changing basis or changing coordinates

Base changes for transformations

$$T: \mathbb{R}^n \rightarrow \mathbb{R}^m$$

- ▶ Suppose that we choose basis B for \mathbb{R}^n and B' for \mathbb{R}^m .
- ▶ $\mathbf{x} \rightarrow T(\mathbf{x})$.
- ▶ $[\mathbf{x}]_B \rightarrow [T(\mathbf{x})]_{B'}$
- ▶ $A[\mathbf{x}]_B = [T(\mathbf{x})]_{B'}$. What is A ?

Theorem 8.1.4 Let $T: \mathbb{R}^n \rightarrow \mathbb{R}^m$ be a linear transformation, let $B = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n\}$ and $B' = \{\mathbf{u}_1, \mathbf{u}_2, \dots, \mathbf{u}_m\}$ be bases for \mathbb{R}^n and \mathbb{R}^m , respectively, and let

$$A = \left[[T(\mathbf{v}_1)]_{B'} \mid [T(\mathbf{v}_2)]_{B'} \mid \cdots \mid [T(\mathbf{v}_n)]_{B'} \right] \quad (23)$$

Then

$$[T(\mathbf{x})]_{B'} = A[\mathbf{x}]_B \quad (24)$$

for every vector \mathbf{x} in \mathbb{R}^n . Moreover, the matrix A given by Formula (23) is the only matrix with property (24).

- ▶ Some formula
 $[T]_{B',B} \rightarrow [[T(v_1)]_{B'}, [T(v_2)]_{B'}, \dots, [T(v_n)]_{B'}]$ and
- ▶ $[T(x)]_{B'} = [T]_{B',B}[x]_B$
- ▶ Example 6.
- ▶ Remark: For operators $T: \mathbb{R}^n \rightarrow \mathbb{R}^n$,
 $[T]_B = [T]_{B,B}$.

Effect of changing basis

- ▶ B_1, B_2 for \mathbb{R}^n , B'_1, B'_2 for \mathbb{R}^m .
- ▶ U transition matrix from $B_2 \rightarrow B_1$
- ▶ V transition matrix from $B'_2 \rightarrow B'_1$
- ▶ $[T]_{B'_1, B_1} = V[T]_{B'_2, B_2}U^{-1}$ (*)
- ▶ Proof: $[T(x)]_{B'_1} = [T]_{B'_1, B_1}[x]_{B_1}$.
 - $V[T(x)]_{B'_2} = [T]_{B'_1, B_1}U[x]_{B_2}$
 - $[T(x)]_{B'_2} = (V^{-1}[T]_{B'_1, B_1}U)[x]_{B_2}$
 - % Use $[w]_{B'} = P_{\{B \rightarrow B'\}}[w]_B$.

Representing Linear operators with two basis.

- ▶ Actually, we can use two basis for \mathbb{R}^n as well.
- ▶ $[T]_{B',B}$.
- ▶ What we used was $[T]_B = [T]_{B,B}$. $B' = B$.
- ▶ So change of basis formula: $[T]_{B_1} = P[T]_B P^{-1}$ for $P = P_{B \rightarrow B_1}$.
- ▶ $V, U = P$ in this case.
- ▶ Thus this follows from (*)
